THERAPEUTIC PEPTIDES

Background of the Invention

This invention relates to therapeutic peptides, in particular analogs of the naturally occurring peptide substance P.

Substance P (SP) has numerous pharmacologic effects including vasodilation and hypotension, contraction of non-vascular smooth muscle, stimulation of salivary and pancreatic secretion, depolarization of various neurons and histamine release from mast cells. SP is thought to play a variety of

physiological roles (many of which are associated with the induction of pain). These include regulation of peristalsis and smooth muscle activity in the gastrointestinal tract, regulation of salivary and pancreatic secretion, regulation of the inflammatory response to peripheral tissue injury, neurotransmission, and regulation of neuro-immunomodulation. Mantyh et al. (1989) Proc. Natl. Acad. Sci. USA 86:5193 reports the presence of substance P receptors at wound sites in the central nervous system and suggests that SP may be involved in regulating the response to injury in the central nervous system as well as in peripheral tissues. Substance P is also a proliferative agent, stimulating the proliferation of fibroblasts, T-lymphocytes, epithelial cells, smooth muscle cells and astrocytes.

SP belongs to a family of bioactive peptides known as the tachykinins. The structure, activity, and function of SP and other tachykinins are discussed in Payan (1989) Ann. Rev. Med. 40:341. As discussed in Payan, SP shares common pharmacological properties and a conserved carboxyl terminal sequence (Phe-X-Gly-Leu-Met-NH₂, where X is a branched aliphatic or aromatic amino acid residue) with the

other tachykinins. The principle biological activities, and the ability to bind to a receptor, reside in the carboxyl terminal sequence of these peptides. Selectivity toward a specific tachykinin receptor is determined by the amino-terminal sequence of the peptides Iverson et al., (1989) The Tachykinin System, Abstract presented at the 11th American Peptide Symposium. The conservation of carboxyl terminal sequence extends beyond SP and other mammalian tachykinins to other bioactive peptides, as shown in Table 1.

Numerous derivatives of SP, made by side chain modification and/or D-amino acid substitution, have been shown to act as SP receptor antagonists. Folkers, U.S. Patent No. 4,481,139, describes substance P antagonists made by D or L amino acid substitution. These antagonists include the undecapeptide analog spantide (D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu-Leu-NH₂) as well as truncated analogs of substance P. Jensen et al. (1988) Am. J. of Physiol. 254: G883 characterized the ability of various SP antagonists to inhibit the action of bombesin. Jensen et al. studied four SP analogues: Arg-D-Pro-Lys-Pro-Gln-Gln-D-Phe-Phe-D-Trp-Leu-Met-NH₂; Arg-D-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu-Met-NH₂; D-Arg-D-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu-Leu-NH₂; and D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu-Leu-NH₂. Jensen et al. also studied two SP analogues with the first 3 amino acid residues deleted, D-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu-Met-NH₂ and D-Pro-Gln-Gln-D-Trp-Phe-D-Trp-D-Trp-Met-NH₂. None of these receptor binding peptides are, however, specific to the SP receptor. All were found to inhibit bombesin-stimulated amylase release. Jensen et al. concluded that "the ability to inhibit the action of bombesin is a general property of SP analogues that also function as SP receptor antagonists and that the SP receptor antagonists are each inhibiting the action of bombesin by functioning as bombesin receptor antagonists."

Woll et al. (1988) Proc. Nat. Acad. Sci. USA 85: 1857 found the substance P antagonist D-Arg-Pro-Lys-Pro-D-Phe-Gln-D-Trp-

Phe-D-Trp-Leu-Leu-NH₂ a potent bombesin antagonist in murine Swiss 3T3 cells.

Agonists and antagonists of a wide spectrum of biologically active peptide hormones, including substance P, have been synthesized by the introduction of modification of the peptide bonds of the peptide hormone, see Spatola (1983) in Chemistry and Biochemistry of Amino Acids, Peptides, and Proteins (B. Weinstein, ed.) M. Dekker, New York and Basel, pp. 267-357, for a recent review of the field.

Abbreviations (uncommon):

cyclohexyl-Ala =

(cyclohexyl alanine)

identifying group

Lys-ε-NHR = lysine wherein the ε-N atom carries an R group

(where R is any of H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, COE (where E is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀ alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), or C₁₋₁₂ acyl);

Nle = H₂N-CH-COOH (norleucine)

identifying group

Nal = naphthylalanine

pGlu = H₂C--CH-COOH (pyroglutamic acid)

Sar = sarcosine

Sta (statine) =

(3S, 4S)-4-amino-3-hydroxy-6-methylheptanoic acid, and has the chemical structure:

AHPPA =

(3S,4S)-4-amino-3-hydroxy-5-phenylpentanoic acid, and has the chemical structure:

ACHPA =

(3S, 4S)-4-amino-5-cyclohexyl-3-hydroxypentanoic acid and has the chemical structure:

SP = Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu-Met-NH₂ (substance P).

Summary of the Invention

In general, the invention features a linear (i.e., non-cyclic) peptide which is an analog of naturally occurring, biologically active substance P having an active site and a binding site responsible for the binding of the peptide to a

receptor on a target cell. The analog has one of the following modifications: (a) a non-peptide bond instead of a peptide bond between an amino acid residue of the active site and an adjacent amino acid residue, (b) a replacement of two amino acid residues within the active site with a synthetic amino acid residue, e.g., statine, AHPPA, ACHPA, a β -amino acid residue, or a γ -amino acid residue, (c) a deletion of an amino acid residue within the active site and a modification of an amino acid residue outside of the active site, or (d) the presence of an N-terminal amino acid residue that is not the naturally occurring amino acid residue of said naturally occurring, biologically active peptide (where β - or γ - is not designated an amino acid is an α -amino acid).

In preferred embodiments the analog is capable of acting as a competitive inhibitor of naturally occurring substance P by binding to the receptor and, by virtue of one of the modifications, failing to exhibit the in vivo biological activity of the naturally occurring peptide.

In preferred embodiments the active site of the linear peptide is in the carboxyl terminal-half of the linear peptide. The linear peptide has one of the following modifications: (a) a non-peptide bond instead of a peptide bond between an amino acid residue of the active site and an adjacent amino acid residue, (b) a replacement of two amino acid residues within the active site with a synthetic amino acid residue, e.g., statine, AHPPA, ACHPA, a β -amino acid residue, or a γ -amino acid residue, (c) a deletion of an amino acid residue within the active site and a modification of an amino acid residue outside of the active site, or (d) the presence of an N-terminal amino acid residue that is not the naturally occurring amino acid residue of said naturally occurring, biologically active peptide.

In preferred embodiments the active site of the linear peptide is in the carboxyl terminal-half of the linear peptide. The linear peptide has one of the following modifications, (a) a non-peptide bond instead of a peptide bond between the carboxyl

terminal amino acid residue and the adjacent amino acid residue, or (b) a statine or AHPPA or ACHPA, β -amino acid, or γ -amino acid residue in place of the naturally occurring carboxyl terminal and adjacent amino acid residues.

5 In preferred embodiments the analog of substance P has one of the following modifications, (a) a non-peptide bond instead of a peptide bond between the carboxyl terminal amino acid residue and the adjacent amino acid residue, or (b) a statine or AHPPA or ACHPA, β -amino acid, or γ -amino acid residue in place of the
10 naturally occurring carboxyl terminal and adjacent amino acid residues.

In preferred embodiments the linear peptide is an analog of substance P with an active site in the carboxyl terminal-half of the linear peptide. The analog of substance P has one of the
15 following modifications: (a) a non-peptide bond instead of a peptide bond between the carboxyl terminal amino acid residue and the adjacent amino acid residue, or (b) a statine or AHPPA or ACHPA or β -amino acid or γ -amino acid residue in place of the naturally occurring carboxyl terminal and adjacent amino acid
20 residues.

The linear peptides for which introduction of a non-peptide bond between two amino acid residues, or the replacement of two natural amino acid residues with a synthetic amino acid residue, a β -amino acid residue, or a γ -amino acid residue, or the
25 deletion ("des") of the C-terminal amino acid residue useful in creating or enhancing antagonist activity are those in which activity is associated with the two C-terminal amino acid residues of the amino acid chain. Therefore, the active site of the naturally occurring peptide of which the peptides of the invention are analogs preferably includes at least one amino acid
30 residue in the carboxy terminal half of the peptide, and the linear peptide of the invention includes that amino acid residue in its carboxy terminal half. Modifications can be introduced in a region involved in receptor binding, or in a non-binding
35 region.

By non-peptide bond is meant that the carbon atom participating in the bond between two residues is reduced from a carbonyl carbon to a methylene carbon, i.e., $\text{CH}_2\text{-NH}$; or, less preferably, $\text{CH}_2\text{-S}$, $\text{CH}_2\text{-CH}_2$, $\text{CH}_2\text{-CO}$, or CO-CH_2 . (A detailed discussion of the chemistry of non-peptide bonds is given in Coy et al. (1988) Tetrahedron 44,3:835-841, hereby incorporated by reference, Tourwe (1985) Janssen Chim. Acta 3:3-15, 17-18, hereby incorporated by reference, and Spatola (1983) in Chemistry and Biochemistry of Amino Acids, Peptides, and Proteins, (B. Weinstein, ed.) M. Dekker, New York and Basel, pp. 267-357, hereby incorporated by reference.)

Preferably, analogs of the invention are 25% homologous, most preferably, 50% homologous, with the naturally occurring peptides.

One modification of the naturally occurring peptide to create an antagonist is to employ, as the amino terminal residue, an aromatic D-isomer of an amino acid, or an alkylated amino acid. (Where "D" is not designated as the configuration of an amino acid, L is intended.)

One class of peptide of the invention includes the substance P analogs of the formula:

wherein

- A^1 = the D or L isomer of any one of the amino acids Arg, Lys, or Lys- $\epsilon\text{-NH-R}_{20}$ (where R_{20} is any of H, C_{1-12} alkyl, C_{7-10} phenylalkyl, COE_{10} (where E_{10} is C_{1-20} alkyl, C_{3-20} alkenyl, C_{3-20} alkynyl, phenyl, naphthyl, or C_{7-10} phenylalkyl), or $\text{C}_1\text{-C}_{12}$ acyl); or is deleted;
- A^2 = the D or L isomer of the amino acid Pro; or is deleted;
- A^3 = the D or L isomer of any one of the amino acids Lys, or Lys- $\epsilon\text{-NH-R}_{22}$ (where R_{22} is any of H, C_{1-12} alkyl,

- C_{7-10} phenylalkyl, COE_{12}^8 (where E_{12} is C_{1-20} alkyl, C_{3-20} alkenyl, C_{3-20} alkynyl, phenyl, naphthyl, or C_{7-10} phenylalkyl), or $C_{1-C_{12}}$ acyl); or is deleted;
- 5 A^4 = the D or L isomer of the amino acid Pro; or is deleted;
- A^5 = the D or L isomer of any one of the amino acids Asp, Gln, β -Nal, Trp, Phe, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3); or is deleted;
- 10 A^6 = the D or L isomer of any one of the amino acids Ala, Arg, Ser, Pro, Gln, pGlu, Asn, β -Nal, Trp, Phe, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), or p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3);
- 15 A^7 = the D or L isomer of any one of the amino acids Val, Thr, Phe, Trp, β -Nal, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), or p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3);
- A^8 = the identifying group of the D or L isomer of any one of the amino acids Gly, Val, Trp, β -Nal, Phe, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), or p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3);
- 20 A^9 = the D or L isomer of any one of the amino acids Sar, His, Gly, Trp, β -Nal, Phe, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), or p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3);
- 25 A^{10} = the identifying group of the D or L isomer of any one of the amino acids Trp, β -Nal, Leu, Nle, Ala, cyclohexyl-Ala, Val, Ile, Met, Gly, Phe, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), or p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3);
- 30 A^{11} = the identifying group of the D or L isomer of any one of the amino acids Trp, β -Nal, Leu, Nle, Ala, Val, Ile, Met, Gly, Phe, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), or p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3); or is deleted; each R_1 and R_2 , independently,
- 35

is any of H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, COE₁₄
 (where E₁₄ is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀
 alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), C₁₋
 C₁₂ acyl, or is deleted, and R₁ and R₂ are bonded to
 the α-amino nitrogen atom of the N-terminal amino acid
 of said peptide, provided that, when one of R₁ or R₂
 is COE₁₄, the other must be H; R₃ is H or C₁₋₁₂ alkyl;
 R₅ is any one of CHZ₁₀-(CH₂)_{n1}-V², CH₂-NH, CH₂-S, CH₂-
 CH₂, CH₂-CO, or CO-CH₂ (where V² is either of

(where each R₇, R₈, and R₉ independently, is H, C₁₋₁₂ alkyl, C₇₋
 10 phenylalkyl, or C₁₂₋₂₀ naphthylalkyl); n₁ is either 1 or 0;
 and Z₁₀ is either of H or OH); R₆ is C or and V¹ is any of

or deleted (where each R₁₀, R₁₁, and R₁₂ independently, is H,
 C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, or C₁₂₋₂₀ naphthylalkyl);
 provided that, where R₅ is CHZ₁₀-(CH₂)_{n1}-V², A¹¹, R₆H, and V¹
 must be deleted; further provided that, where A¹¹, R₆H, and V¹
 are deleted, R₅ must be CHZ₁₀-(CH₂)_{n1}-V²; further provided that,
 where A⁵ is Asp, A⁶ is Ser, A⁷ is Phe, A⁸ is Val, A⁹ is Gly, A¹⁰
 is Leu, A¹¹ is Leu, and R₅ is CH₂NH, at least one of A¹, A², A³,
 or A⁴ must be present; or a pharmaceutically acceptable salt
 thereof.

Another class of peptide of the invention includes the
 substance P analogs of the formula:

- 5 A^{21} = the D or L isomer of any one of the amino acids Arg Lys, or Lys- ϵ -NH- R_{80} (where R_{80} is any of H, C_{1-12} alkyl, C_{7-10} phenylalkyl, COE_{20} (where E_{20} is C_{1-20} alkyl, C_{3-20} alkenyl, C_{3-20} alkynyl, phenyl, naphthyl, or C_{7-10} phenylalkyl), or C_1 - C_{12} acyl); or is deleted;
- 10 A^{22} = the D or L isomer of the amino acid Pro; or is deleted;
 A^{23} = the D or L isomer of any one of the amino acids Lys or Lys- ϵ -NH- R_{82} (where R_{82} is any of H, C_{1-12} alkyl, C_{7-10} phenylalkyl, COE_{22} (where E_{22} is C_{1-20} alkyl, C_{3-20} alkenyl, C_{3-20} alkynyl, phenyl, naphthyl, or C_{7-10} phenylalkyl), or C_1 - C_{12} acyl); or is deleted;
- 15 A^{24} = the D or L isomer of the amino acid Pro; or is deleted;
 A^{25} = the identifying group of the D or L isomer of any one of the amino acids Asp, Gln, β -Nal, Trp, Phe, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3); or is deleted;
- 20 A^{26} = the identifying group of the D or L isomer of any one of the amino acids Arg, Sar, Pro, Gln, pGlu, Phe, Trp, cyclohexyl-Ala, or Asn;
 A^{27} = the identifying group of the amino acid D-Trp; or the identifying group of the D or L isomer of any of Leu, Phe, or cyclohexyl-Ala; or is deleted;
- 25 A^{28} = the identifying group of the D or L isomer of any one of the amino acids Val, β -Nal, Phe, o-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3), or p-X-Phe (where X = F, Cl, Br, NO_2 , OH, or CH_3); or is deleted;
- 30 A^{29} = the identifying group of the amino acid D-Trp; or the identifying group of the D or L isomer of any of Leu, Phe, or cyclohexyl-Ala;
 A^{30} = the identifying group of the D or L isomer of any one of the amino acids Leu, Nle, Ala, cyclohexyl-Ala, Val,

Ile, Met, Gly, Phe, Trp, β -Nal, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃); or is deleted;

5 A³¹ = the identifying group of the D or L isomer of any one of the amino acids Trp, β -Nal, Leu, Nle, Ala, Val, Ile, Met, Gly, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃); or is deleted;

each R₅₁ and R₅₂, independently, is any of H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, COE₂₄ (where E₂₄ is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀ alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), C_{1-C₁₂} acyl, or is deleted, and R₅₁ and R₅₂ are bonded to the α -amino nitrogen atom of the N-terminal amino acid of said peptide, provided that,

10 when one of R₅₁ or R₅₂ is COE₂₄, the other must be H; R₅₃ is C, or is deleted; each R₅₅, and R₆₁, independently is C; each R₅₇, R₅₉, R₆₃, and R₆₅, independently, is either of C or deleted; R₅₄ is CO-NH, CO-NCH₃, or is deleted; each R₅₆ and R₆₂, independently, is any of CO-NH, CHZ₂₀-(CH₂)_{n10}-CO-NH (where n10 is either 1 or 0; and Z₂₀ is either of H or OH), CH₂-NH, CH₂-S, CH₂-CH₂, CH₂-CO, or CO-CH₂; R₅₈ is any of CO-NR₆₉ (where R₆₉ is H or C₁₋₁₂ alkyl), CHZ₂₀-(CH₂)_{n10}-CO-NH, CH₂-NH, CH₂-S, CH₂-CH₂, CH₂-CO, CO-CH₂, or deleted; R₆₀ is CO-NH, or deleted; R₆₄ is any of CO-NH, CHZ₂₀-(CH₂)_{n10}-V¹², CH₂-NH, CH₂-S, CH₂-CH₂, CH₂-CO, CO-CH₂, or deleted (where V¹² is either of

(where each R₇₀, R₇₁, and R₇₂ independently, is H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, or C₁₂₋₂₀ naphthylalkyl); and V¹⁰ is any of

30

or deleted (where each R_{66} , R_{67} , and R_{68} independently, is H, C_{1-12} alkyl, C_{7-10} phenylalkyl, or C_{12-20} naphthylalkyl); provided that, at least one of R_{56} , R_{58} , R_{62} , or R_{64} is other than either CO-NH or CO-NR₆₉; further provided that, where R_{56} is CHZ₂₀-(CH₂)_{n10}-CO-NH, A²⁷, R₅₇H, and R₅₈ must be deleted; further provided that, where A²⁷, R₅₇H, and R₅₈ are deleted, R_{56} must be CHZ₂₀-(CH₂)_{n10}-CO-NH; further provided that, where R_{58} is CHZ₂₀-(CH₂)_{n10}-CO-NH, A²⁸, R₅₉H, and R₆₀ must be deleted; further provided that, where A²⁸, R₅₉H, and R₆₀ are deleted, R_{58} must be CHZ₂₀-(CH₂)_{n10}-CO-NH; further provided that, where R_{62} is CHZ₂₀-(CH₂)_{n10}-CO-NH, A³⁰, R₆₃H, and R₆₄ must be deleted; further provided that, where A³⁰, R₆₃H, and R₆₄ are deleted, R_{62} must be CHZ₂₀-(CH₂)_{n10}-CO-NH; further provided that, where R_{64} is CHZ₂₀-(CH₂)_{n10}-V¹², A³¹, R₆₅H, and V¹⁰ must be deleted; further provided that, where A³¹, R₆₅H, and V¹⁰ are deleted, R_{64} must be CHZ₂₀-(CH₂)_{n10}-V¹²; or a pharmaceutically acceptable salt thereof.

Examples of preferred peptides are:

Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly^L[CH₂-NH]Leu-NH₂; D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp^L[CH₂-NH]Leu-Nle-NH₂; or D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu^L[CH₂-NH]Nle-NH₂. (Non-peptide bonds in which the peptide bond is reduced are symbolized herein by "^L[CH₂-NH]" or "^L").

In another aspect the invention features a substance P agonist of the formula:

Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly^L[CH₂-NH]Leu-Leu-NH₂.

SP antagonists of the invention are useful in the treatment of a patient suffering from diseases involving neurogenic inflammation e.g., rheumatoid arthritis, ulcerative colitis, eczema, and Crohn's disease. The SP antagonists of the invention are useful as antiproliferative agents e.g., in the treatment of small cell lung carcinoma or disorders involving the proliferation of fibroblasts. The antiproliferative properties of the SP antagonists of the invention also allow their use in the prevention of glial scarring (thus facilitating nerve

regeneration). The action of the antagonists of the invention on neurotransmission allow their use as nonopiate analgesics. Their use as nonopiate analgesics can permit the restoration of opiate response. The antagonists of the invention are also useful as antisecretory agents, acting e.g., on the salivary glands or on the pancreas.

In the generic formulas given above, when any of R_1 , R_2 , R_7 - R_{13} , R_{51} , R_{52} , R_{66} - R_{68} , or R_{70} - R_{72} is an aromatic, lipophilic group, the in vivo activity can be long lasting, and delivery of the compounds of the invention to the target tissue can be facilitated.

The identifying group of an α -amino acid (for case of pyroglutamate, see below) is the atom or group of atoms, other than the α -carbonyl carbon atom, the α -amino nitrogen atom, or the H atom, bound to the asymmetric α -carbon atom. To illustrate by examples, the identifying group of alanine is CH_3 , the identifying group of valine is $(\text{CH}_3)_2\text{CH}$, the identifying group of lysine is $\text{H}_3\text{N}^+(\text{CH}_2)_4$ and the identifying group of phenylalanine is $(\text{C}_6\text{H}_5)\text{CH}_2$. The identifying group of a β - or γ -amino acid is the analogous atom or group of atoms bound to respectively, the β - or the γ -carbon atom. Where the identifying group of an amino acid is not specified it may be α , β , or γ . In the case of pyroglutamate the identifying group consists of $-\text{NH}-\text{CO}-\text{CH}_2-\text{CH}_2-$.

Other features and advantages of the invention will be apparent from the following description of the preferred embodiments thereof, and from the claims.

Description of the Preferred Embodiments

We first briefly describe the drawings.

Drawings

Fig. 1 is a pair of graphs illustrating the effect of pseudo-peptides of spantide, D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu-Leu- NH_2 , (left panel) and of SP, Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu-Met- NH_2 , (right panel) on SP-stimulated amylase release from pancreatic acini.

Fig. 2 is a graph showing the effect of Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ on SP-stimulated amylase release from pancreatic acini.

5 Fig. 3 is a pair of graphs illustrating the ability of various SP and spantide pseudopeptides to inhibit binding of ¹²⁵I-BH-substance P to pancreatic acini.

Fig. 4 is a graph showing the ability of SP and spantide pseudopeptides to inhibit binding of ¹²⁵I-[Tyr⁴] bombesin to pancreatic acini.

10 We now describe the structure, synthesis, and use of preferred embodiments of the invention.

Structure

The peptides of the invention all have modifications, e.g., a non-peptide bond in at least one of the indicated
15 positions in which the carbon atom participating in the bond between two residues is reduced from a carbonyl carbon to a methylene carbon. The peptide bond reduction method which yields this non-peptide bond is described in Coy et al., U.S. patent application, Serial No. 879,348, assigned to the same assignee as
20 the present application, hereby incorporated by reference. The peptides of the invention can be provided in the form of pharmaceutically acceptable salts. Examples of preferred salts are those with therapeutically acceptable organic acids, e.g., acetic, lactic, maleic, citric, malic, ascorbic, succinic,
25 benzoic, salicylic, methanesulfonic, toluenesulfonic, or pamoic acid, as well as polymeric acids such as tannic acid or carboxymethyl cellulose, and salts with inorganic acids such as the hydrohalic acids, e.g., hydrochloric acid, sulfuric acid, or phosphoric acid.

30 Synthesis of Substance P Analogs

The synthesis of the substance P antagonist Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂NH]Leu-NH₂ follows. Other substance P analogs can be prepared by making the appropriate modifications of the following synthetic method.

The first step is the preparation of the intermediate Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-benzhydrylamine resin, as follows.

5 Benzhydrylamine-polystyrene resin (Vega Biochemicals, Inc.) (0.97 g, 0.5 mmole) in the chloride ion form is placed in the reaction vessel of a Beckman 990B peptide synthesizer programmed to perform the following reaction cycle: (a) methylene chloride; (b) 33% trifluoroacetic acid (TFA) in methylene chloride (2 times for 1 and 25 min. each); (c) 10 methylene chloride; (d) ethanol; (e) methylene chloride; and (f) 10% triethylamine in chloroform.

The neutralized resin is stirred with alpha-t-butoxycarbonyl(Boc)-leucine and diisopropylcarbodiimide (1.5 mmole each) in methylene chloride for 1 hour, and the resulting amino acid resin is then cycled through steps (a) to (f) in the above wash program. Boc-leucine aldehyde (1.25 mmoles), prepared by the method of Fehrentz and Castro, Synthesis, p. 676 (1983), is dissolved in 5 ml of dry dimethylformamide (DMF) and added to the resin TFA salt suspension followed by the addition of 100 mg 20 (2 mmoles) of sodium cyanoborohydride (Sasaki and Coy, Peptides 8:119-121 (1987); Coy et al., id.). After stirring for 1 hour, the resin mixture is found to be negative to ninhydrin reaction (1 min.), indicating complete derivatization of the free amino group.

25 The following amino acids (1.5 mmole) are then coupled successively in the presence diisopropylcarbodiimide (1.5 mmole), and the resulting amino acid resin is cycled through washing/deblocking steps (a) to (f) in the same procedure as above: Boc-Gly (Boc-Gly is coupled as a 6M excess of the p-nitrophenylester), Boc-Phe, Boc-Phe, Boc-Gln, Boc-Gln, (Boc-Gln is coupled as a 6 M excess of the p-nitrophenylester), Boc-Pro, 30 Boc-Lys, Boc-Pro, and Boc-Arg. The completed resin is then washed with methanol and air dried.

The resin described above (1.6 g, 0.5 mmole) is mixed 35 with anisole (5 ml) and anhydrous hydrogen fluoride (35 ml) at

0°C and stirred for 45 min. Excess hydrogen fluoride is evaporated rapidly under a stream of dry nitrogen, and free peptide is precipitated and washed with ether. The crude peptide is dissolved in a minimum volume of 2 M acetic acid and purified on a column (2.5 x 90 cm) of Sephadex G-25 which is eluted with 2 M acetic acid, followed by preparative medium pressure chromatography on a column (1.5 x 45 cm) of Vydac C₁₈ silica (10-15 µm) which is eluted with linear gradients of acetonitrile in 0.1% trifluoroacetic acid using an Eldex Chromatrol gradient controller (flow rate 1 ml/min). Where necessary, analogues are further purified by re-chromatography on the same column with slight modifications to the gradient conditions when necessary. Homogeneity of the peptides was assessed by thin layer chromatography and analytical reverse-phase high pressure liquid chromatography, and purity was 97% or higher. Amino acid analysis gave the expected amino acid ratios. The presence of the reduced peptide bond was demonstrated by fast atom bombardment mass spectrometry. Each of the analogues gave good recovery of the molecular ion corresponding to the calculated molecular mass.

A statine, AHPPA, ACHPA, β-amino acid, or γ-amino acid residue is added in the same way as is a natural α-amino acid residue, by coupling as a Boc-amino acid. Statine or Boc-statine can be synthesized according to the method of Rich et al., 1978, J. Org. Chem. 43; 3624; Rich et al. (1988) J. Org. Chem. 53:869; and Rich et al., 1980, J. Med. Chem. 23:27. AHPPA can be synthesized according to the method of Hui et al., 1987, J. Med. Chem. 30:1287. ACHPA can be synthesized according to the method of Schuda et al., 1988, Journal of Organic Chemistry 53:873. Boc-coupled synthetic amino acids are available from Nova Biochemicals (Switzerland), Bachem (Torrance, California), and CalBiochem (San Diego, California).

Other compounds can be prepared as above and tested for effectiveness as agonists or antagonists in the following test program.

Phase 1- Amylase Release From Pancreatic Acini

SP stimulates the release of amylase in pancreatic acini. The stimulation or inhibition of release of amylase by pancreatic acini is used as a measure of, respectively, the agonist or antagonist activity of a peptide. Dispersed acini from the pancreas of one animal are suspended in 150 ml of standard incubation solution. Amylase release is measured as described previously (Gardner et al. (1977) J. Physiol. 270: 39). Amylase activity is determined by the methods of Ceska et al. (Ceska et al. (1969) Clin. Chim. Acta. 26:437 and Ceska et al. (1969) Clin. Chim. Acta. 26:445) using the Phadebas reagent. Amylase release is calculated as the percentage of the amylase activity in the acini at the beginning of the incubation that was released into the extracellular medium during the incubation.

Phase 2 - Competitive Inhibition of ^{125}I -Bolton-Hunter-SP Binding

Binding of ^{125}I -Bolton-Hunter-SP (^{125}I -BH-SP) to dispersed pancreatic acini is measured as described previously (Jensen et al. (1984) Biochem. Biophys. Acta. 804:181 and Jensen et al. (1988) Am. J. Physiol. 254:G883). Incubations contain 0.125 nM ^{125}I -BH-SP and 0.1% bacitracin in standard incubation buffer and were for 30 min at 37°C. Nonsaturable binding of ^{125}I -BH-SP is the amount of radioactivity associated with the acini when the incubation contains 0.125 nM ^{125}I -BH-SP plus 1 μM unlabeled SP. All values given are for saturable binding, i.e., binding measured with ^{125}I -BH-SP alone (total binding). In all experiments nonsaturable binding was < 30% of total binding.

Phase 3- Competitive Inhibition of ^{125}I -[Tyr⁴] Bombesin Binding

^{125}I -[Tyr⁴] Bombesin (2200 Ci/mmol) is prepared using a modification of the method described previously (Jensen et al. (1978) Proc. Natl. Acad. Sci. USA 75:6139). Iodo-Gen (mg) is dissolved in 5 ml of chloroform and 5 μl of this solution (1 μg Iodo-Gen) is transferred to a vial under a stream of nitrogen. To this vial 50 μl of KH_2PO_4 (pH 7.4), 6 μg [Tyr⁴] bombesin in 5 μl water and 1 mCi Na^{125}I is added, mixed and incubated for 6 min

at 4°C, at which time the iodination mixture is added to a vial of 1 M dithiothreitol and incubated at 80°C for 60 min. The iodination mixture is then loaded onto a Sep-Pak cartridge and eluted with 0.25 M tetraethylammonium phosphate (TEAP) followed by 50% (vol/vol) acetonitrile-0.25 M TEAP. ¹²⁵I-[Tyr⁴]bombesin is purified using reverse-phase high-performance liquid chromatography (HPCL) and eluted.

Results of Assays of Test Peptides

A number of analogues of substance P, or of the substance P antagonist spantide, each containing a non-peptide bond, can be synthesized and tested in one or more of the assays described in Phase 1 - Phase 3 above. The structure of substance P is Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu-Met-NH₂. Spantide is an analog of SP. The structure of spantide is D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu-Leu-NH₂. Stimulation or inhibition of the release of amylase from dispersed pancreatic acini was used as an assay for SP agonist activity or SP antagonist activity respectively. At a concentration of 10 μM, 9 of 10 SP and spantide derived pseudopeptides failed to stimulate amylase release when present alone (Table 2). One peptide, Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly^L[CH₂-NH]Leu-Leu-NH₂, (10 μM) had agonist activity causing a 3-fold increase in amylase release (Table 2). Each of the 9 pseudopeptides without agonist activity was examined for activity as a SP antagonist. At a concentration of 10 μM each of the spantide derived pseudopeptide analogues inhibited 1 nM-SP-stimulated amylase release. (Table 2) Three SP pseudopeptides, Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂, Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe^L[CH₂-NH]Gly-Leu-Leu-NH₂, and Arg-Pro-Lys-Pro-Gln-Gln^L[CH₂-NH]Phe-Phe-Gly-Leu-Leu-NH₂ caused inhibition (Table 2).

The relative abilities of each peptide to inhibit SP-stimulated amylase release was determined by the effect of peptide dose on inhibition. Dose-inhibition studies were carried out for each of the 9 pseudopeptides using a concentration of SP (1nM) that causes half-maximal stimulation. (Fig. 1). Results

for the 5 spantide derived pseudopeptides are shown in Fig. 1, left panel. D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu^L[CH₂-NH]Nle-NH₂ was equipotent to spantide, causing detectable inhibition at 0.03 μ M and half-maximal inhibition at 1.8 μ M (Table 3). D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp^L[CH₂-NH]Leu-Nle-NH₂ was 2-fold less potent (IC₅₀ 3.5 μ M, Table 3) than spantide. D-Arg-Pro-Lys-Pro-Gln-Gln^L[CH₂-NH]D-Trp-Phe-D-Trp-Leu-Nle-NH₂ was 2.6-times (IC₅₀ 4.7 μ M) less potent than spantide. D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp^L[CH₂-NH]Phe-D-Trp-Leu-Nle-NH₂ was 3.5-times (IC₅₀ 6.4 μ M) less potent and D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe^L[CH₂-NH]D-Trp-Leu-Nle-NH₂ was 17-times (IC₅₀ 30 μ M) less potent than spantide (Table 3).

Results for the SP pseudopeptide analogues are shown in Fig. 1, right panel. Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ was the most potent SP derivative causing detectable inhibition at 0.3 μ M and half-maximal inhibition at 7.1 μ M (Table 3, right). Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe^L[CH₂-NH]Gly-Leu-Leu-NH₂ and Arg-Pro-Lys-Pro-Gln-Gln^L[CH₂-NH]Phe-Phe-Gly-Leu-Leu-NH₂ were less effective, causing detectable inhibition at 10 μ M. They are, respectively, 7-fold and 46-fold less potent than Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ (Table 3, right). Arg-Pro-Lys-Pro-Gln-Gln-Phe^L[CH₂-NH]Phe-Gly-Leu-Leu-NH₂ exhibited no inhibitory activity at concentrations as high as 30 μ M (Fig. 1, right). The most potent SP derived pseudopeptide antagonist was Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ (Fig. 1, Table 2).

The inhibitory effects of the most potent SP derived pseudopeptide antagonist, Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂, are shown in Fig. 2. Acini were incubated with increasing concentrations of SP. Amylase release was detectable with 0.1 nM SP, was half-maximal with 1 nM SP2, and was maximal with 10 nM (Fig. 2). Addition of Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ caused a parallel rightward shift in the dose-response curve for SP-stimulated amylase release. The shift was proportional to the concentration

of Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ added but there was no change in the maximal response (Fig. 2). D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu^L[CH₂-NH]Nle-NH₂ gave similar results (data not shown).

5 The interaction of SP and spantide derived analogues with the SP receptors of pancreatic acini was measured by the ability of a peptide to inhibit the binding of ¹²⁵I-BH-SP to acini. (See Table 3 and Fig. 3.)

10 The spantide derived pseudopeptides show a range of potencies. D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu^L[CH₂NH]Nle-NH₂ is roughly equivalent in potency to spantide causing detectable inhibition at 0.03 μM and half-maximal inhibition at 2.2 μM (Fig. 3, left, Table 3). D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp^L[CH₂-NH]Leu-Nle-NH₂ and D-Arg-Pro-
15 Lys-Pro-Gln-Gln^L[CH₂-NH]D-Trp-Phe-D-Trp-Leu-Nle-NH₂ are 2-fold less potent than spantide. D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp^L[CH₂-NH]Phe-D-Trp-Leu-Nle-NH₂ was 3-times (K_i, 6.3 μM) less potent than spantide. D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe^L[CH₂-NH]D-Trp-Leu-Nle-NH₂ was 7-times (K_i, 14.7 μM) less potent than
20 spantide (Fig. 3, Table 3).

 The SP derived pseudopeptides also show a range of potencies. Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ causes detectable inhibition at 0.1 μM, and half-maximal inhibition at 3 μM. Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly^L[CH₂-
25 NH]Leu-Leu-NH₂ is 1.5-fold lower in potency, Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe^L[CH₂-NH]Gly-Leu-Leu-NH₂ is 20-times less potent, and Arg-Pro-Lys-Pro-Gln-Gln-Phe^L[CH₂-NH]Phe-Gly-Leu-Leu-NH₂ and Arg-Pro-Lys-Pro-Gln-Gln^L[CH₂-NH]Phe-Phe-Gly-Leu-Leu-NH₂ are more than 62-times less potent than Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-
30 Gly-Leu^L[CH₂-NH]Leu-NH₂.

 Unlike previously studied SP analogs the peptides of the invention are specific to the SP receptor. Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ was tested for the ability to inhibit amylase release produced by
35 various pancreatic secretagogues (Table 4). Arg-Pro-Lys-Pro-

Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]²¹Leu-NH₂ (20 μM) inhibited amylase release stimulated by SP, but did not alter bombesin, CCK-8, carbachol, VIP, secretin, CGRP A23187 or TPA stimulated amylase release.

The most potent receptor antagonists were tested for their ability to inhibit the binding of ¹²⁵I-[Tyr⁴] bombesin to the bombesin receptors of pancreatic acini. Spantide inhibited binding of ¹²⁵I-[Tyr⁴] bombesin as reported previously (Jensen et al. (1988) Am. J. Physiol. 254:G883) causing half-maximal inhibition at 3 ± 1 μM and complete inhibition at 100 μM (Fig. 4). D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu^L[CH₂-NH] Nle-NH₂ inhibited ¹²⁵I-[Tyr⁴] bombesin binding but was 3-fold less potent than spantide causing half-maximal inhibition at 10 μM (p < 0.05 compared to spantide) (Fig. 4). Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH] Leu-NH₂ did not cause detectable inhibition until concentrations above 30 μM and had a calculated K_i of 300 ± 20 μM. Spantide and D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp-Leu^L[CH₂-NH]Nle-NH₂ had a 3- to 10-fold lower affinity for inhibiting ¹²⁵I-[Tyr⁴] bombesin binding as compared to ¹²⁵I-BH-SP.

The ability of Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ to inhibit binding of ¹²⁵I-[Tyr⁴] bombesin was 70-fold lower than its ability to inhibit binding of ¹²⁵I-BH-SP.

Use

The peptides of the invention may be administered to a mammal, particularly a human, in one of the traditional modes (e.g., orally, parenterally, transdermally, or transmucosally), in a sustained release formulation using a biodegradable biocompatible polymer, or by on-site delivery using micelles, gels and liposomes.

The peptides can be administered to a human patient in a dosage of 0.5 μg/kg/day to 5 mg/kg/day.

30	Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu-Met-NH ₂ (SP)	0.0025 ± 0.0005		No-Agonist
	Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu ^L [CH ₂ -NH]Leu-NH ₂	4.3 ± 0.3		$7.1 \pm 0.9^*$
35	Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly ^L [CH ₂ -NH]Leu-Leu-NH ₂	5.6 ± 2.2		No-Agonist
40	Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe ^L [CH ₂ -NH]Gly-Leu-Leu-NH ₂	41.3 ± 16.7		>30
	Arg-Pro-Lys-Pro-Gln-Gln-Phe ^L [CH ₂ -NH]Phe-Gly-Leu-Leu-NH ₂	265.0 ± 89.0		>30
45	Arg-Pro-Lys-Pro-Gln-Gln ^L [CH ₂ -NH]Phe-Phe-Gly-Leu-Leu-NH ₂	310.0 ± 88.0		>30

Values are means \pm 1SEM. ²⁵ Kd values for SP are obtained from
Scatchard analysis of ¹²⁵I-labeled SP binding studies. K_i values
for agonist or antagonists from studies of binding ¹²⁵I-BH-SP
were obtained according to the equation: $K_i = \frac{R}{1-R} \left(\frac{SB}{S+A} \right)$
5 where R is the observed saturable binding of ¹²⁵I-BH-SP in the
presence of antagonist (B) expressed as a fraction of that
obtained when B is not present; A is the concentration of ¹²⁵I-
BH-SP (0.125 nM). B is the concentration of antagonist, S is the
K_d of SP determined by Scatchard analysis. No-agonist = peptide
10 not tested for inhibition activity because agonist activity when
present alone.

Table 4. Ability of Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]Leu-NH₂ to affect amylase release stimulated by various secretagogues.

Secretagogue	Amylase Release (percent total)	
	Alone	Leu ^L , L10-11-SP (20 μ M)
None	2.7 \pm 0.4	2.3 \pm 0.3
Substance P (1 nM)	8.7 \pm 1.8	4.3 \pm 0.5*
CCK-8 (0.1 nM)	19.7 \pm 4.2	21.6 \pm 4.9
Bombesin (0.3 nM)	14.8 \pm 4.1	14.3 \pm 3.1
Carbachol (10 μ M)	22.7 \pm 4.1	20.7 \pm 4.3
VIP (0.3 nM)	20.5 \pm 3.5	18.9 \pm 4.2
Secretin (0.1 μ M)	18.9 \pm 3.6	18.8 \pm 4.1
CGRP (0.1 μ M)	12.1 \pm 3.3	12.0 \pm 3.9
A23187 (0.1 μ M)	9.9 \pm 1.5	11.6 \pm 1.6
TPA (0.1 μ M)	32.2 \pm 5.7	30.2 \pm 5.6

*Significantly less than secretagogue alone p < 0.001

Acini were incubated for 30 min at 37°C with various pancreatic secretagogues alone or with Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-Leu^L[CH₂-NH]LeuNH₂. In each experiment, each value was determined in duplicate, and results give means \pm 1SEM from at least 4 separated experiments. Abbreviations: CCK-8, COOH-terminal octapeptide of cholecystokinin; VIP, vasoactive intestinal peptide, respectively; CGRP, calcitonin gene-related peptide; A23187 and TPA, 1,2-o-tetradecanoylphorbol-1,3-acetate.

Claims

1. A linear peptide which is an analog of naturally occurring, biologically active substance P having an active site and a binding site responsible for the binding of said peptide to a receptor on a target cell, said analog having one of the following modifications, (a) a non-peptide bond instead of a peptide bond between an amino acid residue of said active site and an adjacent amino acid residue, (b) a statine or AHPPA or ACHPA or β -amino acid or γ -amino acid residue in place of two naturally occurring amino acid residues of said active site, (c) a deletion of an amino acid residue within the active site and a modification of an amino acid residue outside the active site, or (d) the presence of an N-terminal amino acid residue that is not the natural N-terminal amino acid residue of said naturally occurring, biologically active peptide.

2. A linear peptide, which is an analog of substance P, of claim 1 wherein said analog is capable of binding to said receptor, so that said analog is capable of acting as a competitive inhibitor of said naturally occurring peptide by binding to said receptor and, by virtue of one of said modifications, failing to exhibit the in vivo activity of said naturally occurring peptide.

3. A linear peptide of claim 1 wherein said active site of said linear peptide is in the carboxyl terminal-half of said linear peptide, said linear peptide having one of the following modifications, (a) a non-peptide bond instead of a peptide bond between an amino acid residue of said active site and an adjacent amino acid residue, (b) a statine or AHPPA or ACHPA or β -amino acid or γ -amino acid residue in place of two naturally occurring amino acid residues of said active site, (c) a deletion of an amino acid residue within the active site and a modification of an amino acid residue outside the active site, or (d) the presence of an N-terminal amino acid residue that is not

the natural N-terminal amino acid residue of said naturally occurring, biologically active peptide.

4. A linear peptide of claim 1 wherein said active site of said linear peptide is in the carboxyl terminal-half of said linear peptide, said linear peptide having one of the following modifications, (a) a non-peptide bond instead of a peptide bond between the carboxyl terminal amino acid residue and the adjacent amino acid residue, or (b) a statine or AHPPA or ACHPA or β -amino acid or γ -amino acid residue in place of the naturally occurring carboxyl terminal and adjacent amino acid residues.

5. A linear peptide of claim 1 wherein said linear peptide is an analog of naturally occurring, biologically active substance P, said analog having one of the following modifications, (a) a non-peptide bond instead of a peptide bond between an amino acid residue of said active site and an adjacent amino acid residue, or (b) a statine or AHPPA or ACHPA or β -amino acid or γ -amino acid residue in place of two naturally occurring amino acid residues of said active site.

6. The substance P analog of claim 5 wherein said analog is at least 25% homologous with naturally occurring substance P.

7. The substance P analog of claim 5 wherein said analog is at least 50% homologous with naturally occurring substance P.

8. The substance P analog of claim 5 of the formula:

wherein

A^1 = the D or L isomer of any one of the amino acids Arg, Lys, or Lys- ϵ -NH- R_{20} (where R_{20} is any of H, C_{1-12}

- alkyl, C₇₋₁₀ ³⁰phenylalkyl, COE₁₀ (where E₁₀ is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀ alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), or C_{1-C₁₂} acyl); or is deleted;
- 5 A² = the D or L isomer of the amino acid Pro; or is deleted;
- A³ = the D or L isomer of any one of the amino acids Lys, or Lys-ε-NH-R₂₂ (where R₂₂ is any of H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, COE₁₂ (where E₁₂ is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀ alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), or C_{1-C₁₂} acyl); or is deleted;
- 10 A⁴ = the D or L isomer of the amino acid Pro; or is deleted;
- A⁵ = the D or L isomer of any one of the amino acids Asp, Gln, β-Nal, Trp, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃); or is deleted;
- 15 A⁶ = the D or L isomer of any one of the amino acids Ala, Arg, Ser, Pro, Gln, pGlu, Asn, β-Nal, Trp, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃);
- 20 A⁷ = the D or L isomer of any one of the amino acids Val, Thr, Phe, Trp, β-Nal, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃);
- 25 A⁸ = the identifying group of the D or L isomer of any one of the amino acids Gly, Val, Trp, β-Nal, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃);
- 30 A⁹ = the D or L isomer of any one of the amino acids Sar, His, Gly, Trp, β-Nal, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃);
- 35 A¹⁰ = the identifying group of the D or L isomer of any one of the amino acids Trp, β-Nal, Leu, Nle, Ala, cyclohexyl-Ala, Val, Ile, Met, Gly, Phe, o-X-Phe

(where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe

(where X = F, Cl, Br, NO₂, OH, or CH₃);

A¹¹ = the identifying group of the D or L isomer of any one of the amino acids Trp, β-Nal, Leu, Nle, Ala, Val, Ile, Met, Gly, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃); or is deleted;

each R₁ and R₂, independently, is any of H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, COE₁₄ (where E₁₄ is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀ alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), C_{1-C₁₂} acyl, or is deleted, and R₁ and R₂ are bonded to the α-amino nitrogen atom of the N-terminal amino acid of said peptide, provided that, when one of R₁ or R₂ is COE₁₄, the other must be H; R₃ is H or C₁₋₁₂ alkyl; R₅ is any one of CHZ₁₀-(CH₂)_{n1}-V², CH₂-NH, CH₂-S, CH₂-CH₂, CH₂-CO, or CO-CH₂ (where V² is either of

(where each R₇, R₈, and R₉ independently, is H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, or C₁₂₋₂₀ naphthylalkyl); n₁ is either 1 or 0; and Z₁₀ is either of H or OH); R₆ is C or and V¹ is any of

or deleted (where each R₁₀, R₁₁, and R₁₂ independently, is H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, or C₁₂₋₂₀ naphthylalkyl); provided that, where R₅ is CHZ₁₀-(CH₂)_{n1}-V², A¹¹, R₆H, and V¹ must be deleted; further provided that, where A¹¹, R₆H, and V¹ are deleted, R₅ must be CHZ₁₀-(CH₂)_{n1}-V²; further provided that, where A⁵ is Asp, A⁶ is Ser, A⁷ is Phe, A⁸ is Val, A⁹ is Gly, A¹⁰ is Leu, A¹¹ is Leu, and R₅ is CH₂NH, at least one of A¹, A², A³, or A⁴ must be present; or a pharmaceutically acceptable salt thereof.

9. The substance P analog of claim 5 of the formula:

wherein

- 10 A^{21} = the D or L isomer of any one of the amino acids Arg Lys, or Lys- ϵ -NH-R₈₀ (where R₈₀ is any of H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, COE₂₀ (where E₂₀ is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀ alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), or C_{1-C12} acyl); or is deleted;
- 15 A^{22} = the D or L isomer of the amino acid Pro; or is deleted;
- A^{23} = the D or L isomer of any one of the amino acids Lys or Lys- ϵ -NH-R₈₂ (where R₈₂ is any of H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, COE₂₂ (where E₂₂ is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀ alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), or C_{1-C12} acyl); or is deleted;
- 20 A^{24} = the D or L isomer of the amino acid Pro; or is deleted;
- A^{25} = the identifying group of the D or L isomer of any one of the amino acids Asp, Gln, β -Nal, Trp, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃); or is deleted;
- 25 A^{26} = the identifying group of the D or L isomer of any one of the amino acids Arg, Sar, Pro, Gln, pGlu, Phe, Trp, cyclohexyl-Ala, or Asn;
- A^{27} = the identifying group of the amino acid D-Trp; or the identifying group of the D or L isomer of any of Leu, Phe, or cyclohexyl-Ala; or is deleted;
- 30 A^{28} = the identifying group of the D or L isomer of any one of the amino acids Val, β -Nal, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃); or is deleted;

- A²⁹ = the identifying group of the amino acid D-Trp; or the identifying group of the D or L isomer of any of Leu, Phe, or cyclohexyl-Ala;
- 5 A³⁰ = the identifying group of the D or L isomer of any one of the amino acids Leu, Nle, Ala, cyclohexyl-Ala, Val, Ile, Met, Gly, Phe, Trp, β-Nal, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃); or is deleted;
- 10 A³¹ = the identifying group of the D or L isomer of any one of the amino acids Trp, β-Nal, Leu, Nle, Ala, Val, Ile, Met, Gly, Phe, o-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃), or p-X-Phe (where X = F, Cl, Br, NO₂, OH, or CH₃); or is deleted;
- 15 each R₅₁ and R₅₂, independently, is any of H, C₁₋₁₂ alkyl, C₇₋₁₀ phenylalkyl, COE₂₄ (where E₂₄ is C₁₋₂₀ alkyl, C₃₋₂₀ alkenyl, C₃₋₂₀ alkynyl, phenyl, naphthyl, or C₇₋₁₀ phenylalkyl), C_{1-C12} acyl, or is deleted, and R₅₁ and R₅₂ are bonded to the α-amino nitrogen atom of the N-terminal amino acid of said peptide, provided that, when one of R₅₁ or R₅₂ is COE₂₄, the other must be H; R₅₃ is C,
- 20 or is deleted; each R₅₅, and R₆₁, independently is C; each R₅₇, R₅₉, R₆₃, and R₆₅, independently, is either of C or deleted; R₅₄ is CO-NH, CO-NCH₃, or is deleted; each R₅₆ and R₆₂, independently, is any of CO-NH, CHZ₂₀-(CH₂)_{n10}-CO-NH (where n10 is either 1 or 0; and Z₂₀ is either of H or OH), CH₂-NH, CH₂-S,
- 25 CH₂-CH₂, CH₂-CO, or CO-CH₂; R₅₈ is any of CO-NR₆₉ (where R₆₉ is H or C₁₋₁₂ alkyl), CHZ₂₀-(CH₂)_{n10}-CO-NH, CH₂-NH, CH₂-S, CH₂-CH₂, CH₂-CO, CO-CH₂, or deleted; R₆₀ is CO-NH, or deleted; R₆₄ is any of CO-NH, CHZ₂₀-(CH₂)_{n10}-V¹², CH₂-NH, CH₂-S, CH₂-CH₂, CH₂-CO, CO-CH₂, or deleted (where V¹² is either of

30

(where each R_{70} , R_{71} , and R_{72} independently, is H, C_{1-12} alkyl, C_{7-10} phenylalkyl, or C_{12-20} naphthylalkyl); and v^{10} is any of

or deleted (where each R_{66} , R_{67} , and R_{68} independently, is H, C_{1-12} alkyl, C_{7-10} phenylalkyl, or C_{12-20} naphthylalkyl); provided that, at least one of R_{56} , R_{58} , R_{62} , or R_{64} is other than either CO-NH or CO-NR₆₉; further provided that, where R_{56} is CHZ₂₀⁻ (CH₂)_{n10}-CO-NH, A²⁷, R_{57} H, and R_{58} must be deleted; further provided that, where A²⁷, R_{57} H, and R_{58} are deleted, R_{56} must be CHZ₂₀⁻(CH₂)_{n10}-CO-NH; further provided that, where R_{58} is CHZ₂₀⁻(CH₂)_{n10}-CO-NH, A²⁸, R_{59} H, and R_{60} must be deleted; further provided that, where A²⁸, R_{59} H, and R_{60} are deleted, R_{58} must be CHZ₂₀⁻(CH₂)_{n10}-CO-NH; further provided that, where R_{62} is CHZ₂₀⁻(CH₂)_{n10}-CO-NH, A³⁰, R_{63} H, and R_{64} must be deleted; further provided that, where A³⁰, R_{63} H, and R_{64} are deleted, R_{62} must be CHZ₂₀⁻(CH₂)_{n10}-CO-NH; further provided that, where R_{64} is CHZ₂₀⁻(CH₂)_{n10}-V¹², A³¹, R_{65} H, and v^{10} must be deleted; further provided that, where A³¹, R_{65} H, and v^{10} are deleted, R_{64} must be CHZ₂₀⁻(CH₂)_{n10}-V¹²; or a pharmaceutically acceptable salt thereof.

25

10. The substance P analog of claim 9 of the formula:
Arg-Pro-Lys-Pro-Gln-Gln-Phe-Phe-Gly-
Leu^L[CH₂-NH]Leu-NH₂;

30 11. The substance P analogs of claim 10 of the formula:

D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe- D-Trp^L [CH₂-NH]Leu-Nle-NH₂; or

D-Arg-Pro-Lys-Pro-Gln-Gln-D-Trp-Phe-D-Trp- Leu^L[CH₂-NH]Nle-NH₂.
